Since the birth of civilization, human beings have manipulated other life-forms. We have selectively bred plants and animals for thousands of years to maximize agricultural production and cater to our tastes in pets. In *Redesigning Life: How Genome Editing Will Transform the World*, John Parrington traces a history of genetic engineering, focusing particularly on recent, rapid developments in the capacity to manipulate genomes. The next few chapters look at how genome editing can be applied to solve diseases in ways which were not previously possible, for example, through its application to embryonic stem cells, bacteria and synthetic cells. His final chapter is the largest and most speculative, and looks at the impact that genome editing could have in the future.
